

ITUK Completes first Communication Map in Spanish

ITUK completes the first communication map in Spanish! This product will be used by UN-ISDR and their partner CIIFEN (International Research Centre on El Nino) in support to current activities related to “Climate Information applied to Agriculture Risk management in the Andean Region”. The communication map, which was created in both English and Spanish, was based on the basic and thematic maps produced last year and is targeted to an audience with a general interest in disaster risk reduction. The A0 size poster shows the thematic risk analysis and the flood extent that occurred during the major flooding of Ecuador in 1998. The purpose of the map is to explain to a general-public audience how satellite imagery and geographic information can benefit disaster risk reduction.

Infoterra Ltd provides communication mapping as a specialised service within Respond that permits users to display a variety of both geographic and non-geographic data and place their activities in context when supporting or justifying their operations. These products are particularly useful for donor fundraising activities for NGOs and Charities. For further information on this service, please contact Helen Stannard via feedback@respond-int.org.
